ITEC 101: HUMAN COMPUTER INTERACTION 2

1. Swimstrim.com

2.

NO.	RULES	Insights/Comments
1	Strive for consistency	The theme was somehow consistent, it uses a relative color palette which is very nice. Every page has the same color palette and same layout.
2	Enable frequent users to use shortcuts	It uses navigation which makes it easier to access the different pages of the website, but the website doesn't support a shortcut key.
3	Offer informative feedback	The buttons and other controls of the website don't have a tooltip so users must search first to google if there was terminology that they are not familiar with.
4	Design dialogs to yield closure	There was a modal that will prompt if you successfully finish the task, for example, if you will compare two regions in runeterra there will be a modal that will appear that you already compared two regions in this website.
5	Prevent errors	The website handles errors like input mismatch and so on.
6	Permit easy reversal of actions	The website can reverse an action without making the whole webpage reload. It uses AJAX for that feature.
7	Keep users in control	Users is in control of all the actions except for the content because it was published by the admin.
8	Reduce short-term Memory load	The display was somehow complicated and have redundant features, like the contacts you can access contacts through the navigation and to the footer.
